

Homework 18 due by the end of class on April 18.

Name \_\_\_\_\_

Plot the supply and demand curves:

S:  $P = 1 + 1(QS)$

D:  $P = 9 - 1(QD)$

Equilibrium:  $Q^E = (B1)$  \_\_\_\_\_

$P^E = (B2)$  \_\_\_\_\_

The supply curve is also a

$(B3)$  \_\_\_\_\_

curve.

The demand curve is also a

$(B4)$  \_\_\_\_\_

curve.

The supply curve is upward-sloping because producers require a

$(B5)$  \_\_\_\_\_ price before

they increase production.

Plot the supply and demand curves

S:  $P = 2 + 2(QS)$

D:  $P = 18 - 2(QD)$

Equilibrium:  $Q^E = (B6)$  \_\_\_\_\_

$P^E = (B7)$  \_\_\_\_\_

Now suppose that the demand curve formula changes to

$D' : P = 14 - 2(QD)$

Under this new demand curve,

consumers value each unit

$(B8)$  \_\_\_\_\_ then they did before.

This new formula represents a(n)

$(B9)$  \_\_\_\_\_ in demand.

Homework 18 due by the end of class on April 18.

Plot the supply and demand curves:

$$S: P = 10 + 0.5(QS)$$

$$D: P = 15 - 2(QD)$$

Equilibrium:  $Q^E = (B10)$ \_\_\_\_\_

$P^E = (B11)$ \_\_\_\_\_

Suppose the supply curve changes to:

$$S': P = 10 + 3(QS)$$

This new supply curve represents a(n) (B12)\_\_\_\_\_ in supply.

Under this new supply curve the marginal cost of producing each good (B13)\_\_\_\_\_.

After this shift the equilibrium price of the good is (B14)\_\_\_\_\_

and the quantity is (B15)\_\_\_\_\_.

Plot the supply and demand curves

$$S: P = 6 + 2(QS)$$

$$D: P = 14 - 2(QD)$$

Equilibrium:  $Q^E = (B16)$ \_\_\_\_\_

$P^E = (B17)$ \_\_\_\_\_

Now suppose that the demand curve formula changes to

$$D': P = 18 - 2(QD)$$

This new formula represents a(n)

(B18)\_\_\_\_\_ in demand.

Suppose these are the supply and demand curves for beef. This shift in the beef demand curve could then be caused by a(n) (B19)\_\_\_\_\_ in pork prices.

Homework 18 due by the end of class on April 18.

Plot the supply and demand curves:

S:  $P = 6 + 1(QS)$

D:  $P = 16 - 1(QD)$

Equilibrium:  $Q^E = (B20)$ \_\_\_\_\_

$P^E = (B21)$ \_\_\_\_\_

Suppose the supply curve formula changes to

$S' : 10 + 1(QS)$

This shift denotes a(n)  $(B22)$ \_\_\_\_\_ in supply because at any given price suppliers will now produce  $(B23)$ \_\_\_\_\_ at any given price.

After this shift the equilibrium price of the good  $(B24)$ \_\_\_\_\_ and the quantity  $(B25)$ \_\_\_\_\_.

Plot the supply and demand curves

S:  $P = 8 + 2(QS)$

D:  $P = 18 - 3(QD)$

Label the equilibrium price and quantity as  $P^E$  and  $Q^E$ , respectively.

Illustrate an increase in demand by shifting the demand curve appropriately and labeling it  $D'$ .

Draw your new demand curve as a parallel shift, where the intercept of the demand curve formula changes but the slope does not.

This new demand curve has a  $(B26)$ \_\_\_\_\_ intercept than the old demand curve.

Homework 18 due by the end of class on April 18.

Plot the supply and demand curves  
 S:  $P = 10 + 1.5(QS)$   
 D:  $P = 20 - 3.5(QD)$

Label the equilibrium price and quantity as  $P^E$  and  $Q^E$ , respectively.

Illustrate an increase in supply by shifting the supply curve appropriately and labeling it  $S'$ .

Draw your new supply curve using the same intercept of 10 but a different slope.

This new supply curve slope is (B27)\_\_\_\_\_ than the old supply curve.

To the left are arbitrary supply and demand curves. Illustrate an increase in demand by shifting the demand curve appropriately.

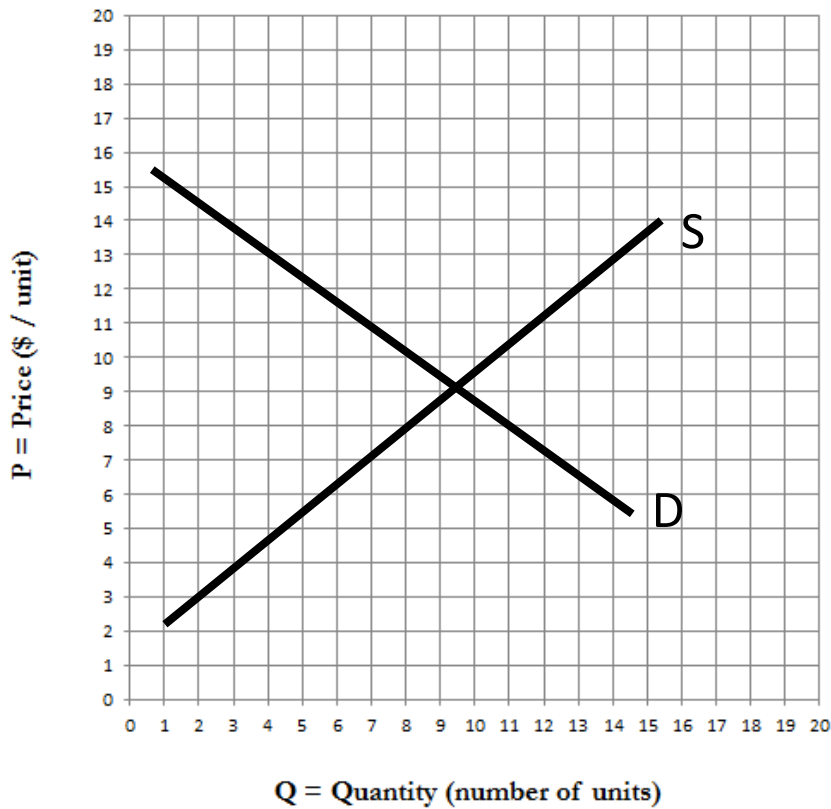

Due to this demand increase, the equilibrium price (B28)\_\_\_\_\_ and the equilibrium quantity (B29)\_\_\_\_\_.

Homework 18 due by the end of class on April 18.

To the left are arbitrary supply and demand curves. Illustrate a decrease in demand by shifting the demand curve appropriately.

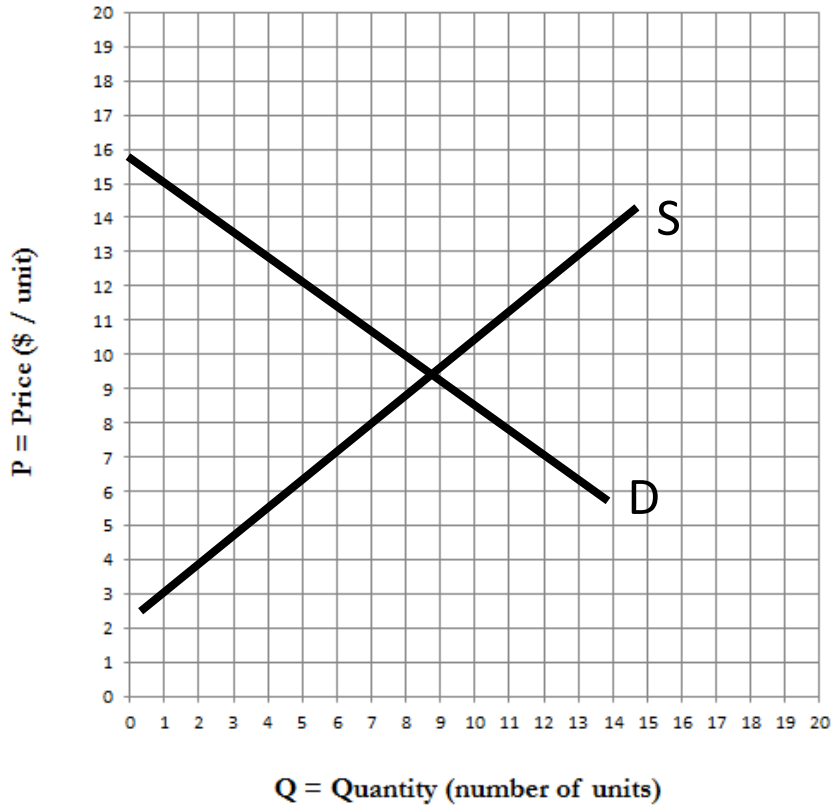

Due to this demand decrease, the equilibrium price (B30) \_\_\_\_\_ and the equilibrium quantity (B31) \_\_\_\_\_.

To the left are arbitrary supply and demand curves. Illustrate an increase in supply by shifting the supply curve appropriately.

Due to this supply increase, the equilibrium price (B32) \_\_\_\_\_ and the equilibrium quantity (B33) \_\_\_\_\_.

Homework 18 due by the end of class on April 18.

To the left are two supply and demand curves. Illustrate an decrease in supply by shifting the supply curve appropriately.

Due to this supply decrease, the equilibrium price (B34) \_\_\_\_\_ and the equilibrium quantity (B35) \_\_\_\_\_.

To the left are arbitrary supply and demand curves. Suppose we know that the equilibrium price decreases and the equilibrium quantity increases. Identify the shift in one and only one curve that could cause this.

For price to fall and quantity to rise, the (B36) \_\_\_\_\_ curve must shift (B37) \_\_\_\_\_, illustrating a(n) (B38) \_\_\_\_\_ in (B39) \_\_\_\_\_.
